Node JS assignment

Create a Todo back-end application with authentication.

1. When the user enters the platform. The user needs to be sign-up/sign-in for creating the todo list.
2. Authentication token needs to be created with the help of user credentials.
3. The user will be able to Create, update, delete, see the list of todo created and also be able to see a particular todo which the user has created.
4. User should able to search to do list based on search string.
5. All of the APIs should have pagination support.
6. Users may be able to tag the todo to pin or make it their favorite.
7. The user information and todo list needs to be stored in mongo dB.

Additional points :

1. Postman link for the todo application with sample responses for each API.
2. Read.me file in the github repository.
3. Create authentication token with separate key files.
